

We have a List of booleans. Let's check if the majority of elements are true.

[t, t, f, t, f]
[t, t, f, t, f]
3 > 2

Some cases worth mentioning: 1) an empty list should return false; 2) if trues and falses have an equal amount, function should return false.

Input: A List of booleans.

Output: A Boolean.

Example:

```
1 is_majority([True, True, False, True, False]) == True
2 is_majority([True, True, False]) == True
```
