You are given a string and you have to find its first word.

This is a simplified version of the [First Word](#) mission, which can be solved later.

- The input string consists of only English letters and spaces.
- There aren't any spaces at the beginning and the end of the string.

**Input:** A string.

**Output:** A string.

**Example:**

```
1  first_word("Hello world") == "Hello"
```

**How it is used:** *The first word is a command in a command line.*

**Precondition:** *The text can contain a-z, A-Z and spaces.*
